

● JESS MOVE

Can't spy.
Can't nag.
Can't exclude.

Small Moves. Powerful Change.

A movement and food-intelligence platform for your workforce. Those three are in the code, not the contract — and your engineers can check all three before you sign anything.

● THE QUESTION YOUR PEOPLE WILL ASK

Can my employer see what I did today?

No.

Not restricted. Not audited. Not switchable by a super-admin. Absent.

OrganisationReport

`apps/backend/src/groups/groups.logic.ts` — the type your engineers can read in five minutes.

Why that answer holds

- The report type has no field for a person. Size, participation, active count, median, suppression flag. A client asking for a name does not compile.
- Permissions get granted when somebody senior asks. There is no permission to grant. Adding one means a schema change, a migration and a code review.
- A cohort figure needs 8 contributing people. Below that it is null — not rounded, not estimated, not "approximately".

● WHY THE LAST ONE FAILED

You have bought this before.

Nobody opened it

Bought, announced, used enthusiastically for a fortnight, quietly abandoned. Renewal becomes a conversation about why.

Nobody trusted it

Anything that can show an employer one person's activity eventually will. Your people assume that, and behave accordingly.

It paid the already-fit

Step challenges reward the people who needed them least. The employee who needed it most could not take part.

The second and third are architecture, not effort. No amount of internal comms fixes either one, and both were decided before a line of interface was written.

● WHY ENGAGEMENT DOES NOT DECAY

It knows when to say nothing.

A prompt delivered while somebody is driving costs attention, then trust, then the notification switch. After that the programme is over however good the advice was. So a block counts here as a success, not a failed delivery.

What silences a prompt

- Driving, from motion state rather than location
- On a call, in a lesson, or notifications turned off
- The daily cap, which differs by age band
- Quiet hours, the sleep window, or an active cooldown
- A clinical rest flag, a safeguarding hold or a bereavement hold

We read the calendar without reading it

Start time, end time, busy or free, attendee count, whether it recurs. That is the whole list.

The title is never transmitted, never logged, never sent to a model. It costs us accuracy — a one-to-one and a board review look identical to us — and we take the worse recommendation.

● NOBODY IS EXCLUDED BY DESIGN

Five variants, or it does not ship.

Every movement exists as five separately authored variants. Not one version with things taken out — a good seated movement uses the chair. The publishing gate refuses anything less. No force-publish flag, no admin override.

1

Standing

2

Seated

3

Chair-supported

4

Bed / Recliner

5

Single-limb /
Adaptive

Four of the six age bands are working age — 18–39, 40–64 and 65–79, plus apprentices under 18. The band is derived, not chosen, and it changes the mechanics, the daily prompt cap and the clinical guardrails. It is not one programme with the age swapped.

● WHAT YOU ACTUALLY RECEIVE

Enough to run a programme. Not enough to manage a person.

Today

The cohort report returns

- Participation rate across the cohort
- How many people were active
- Median days moved in the period
- Whether the answer was suppressed, and the floor

Not built yet

Yours to prioritise as a design partner

- A trend series against a baseline
- Sedentary-risk distribution by cohort
- A return-on-investment model, assumptions shown
- Single sign-on and directory sync

Below eight contributing people every figure is null, not rounded — for you as well as for everyone else. An eleven-person company cannot have anonymous reporting however it is sold.

● FOR YOUR SECURITY REVIEW

Don't trust us. Call the API.

Checkable from a terminal — no account, no NDA, nobody from us in the room. 32 controls: 21 enforced in code, 7 implemented, 4 open. 942 automated tests behind the four responses below.

GET `/api/assurance`

Every control, its status, and the gaps — listed at the top, not buried.

GET `/api/movements/gate`

The publishing contract: five variants, a cue set per age band, no override.

POST `/api/body/assess`

Send a twelve-year-old with consent set true. It returns metrics: null.

GET `/api/health`

A live check that opens a database connection, never a stored badge.

Four things enforced. Four things open.

Enforced in code and schema

- A declared condition is stored as a catalogue identifier. No severity, no dates, no medication, no free text.
- Deleting an account cascades in the database from the user row — a guarantee, not a callback somebody has to remember.
- Health data never reaches an organisation view at any cohort size. A test asserts that no module outside the conditions service touches that table.
- Analytics identifiers are hashed on arrival with a salt regenerated daily, and never outlive the request.

Open, and named before you ask

- No external WCAG 2.2 AA audit and no VPAT. Accessibility is designed for and tested in places, not certified.
- Age is self-declared. Ofcom's position is that self-declaration is not highly effective age assurance.
- A member can read their whole record through their own endpoints, but there is no one-click export archive yet.
- The Clinical Safety Officer appointment record is incomplete against DCB0129, and the hazard log says so itself.

We did not assemble the right-hand column for this slide. It is what GET /api/assurance returns to anybody who calls it, gaps lifted to the top of the response rather than left to be found area by area.

● THE DEAL

You would be our first.

Every vendor in this category opens with logos. We have none — no customers, no case study, no measured outcome. So we are not asking you to believe a result. We are asking you to help produce the first one, and pricing it accordingly.

0

organisations have run a cohort

3-5

design partners, and we want no more

£2

a seat, held for the whole first year

What a design partner gets that customer six will not

- The floor price, held for twelve months
- First call on the order of the four unbuilt things on slide six
- A named sponsor on our side, not a ticket queue
- A twelve-week pilot that ends at week twelve unless you say otherwise

Once there is a case study, this conversation costs more and includes less. That is not a tactic — it is what happens to every design-partner programme that works.

From £2 per employee per month.

from £2

per seat, per month

The floor, not a teaser. Up to £5 depending on sector, seat count and support level. Organisation deals are contracts, so the figure is agreed rather than picked at a checkout.

Minimum 10 seats

Annual term once a pilot converts, not before.

Challenge builder and campaigns

Branded to your organisation.

Setup and integration support

Included in every contract.

Single sign-on and directory sync

Contracted, not yet built. Delivered inside the pilot.

One invoice, one contract, one line in the benefits budget. No per-feature upsell and no device to buy.

● THE ASK

One team. Twelve weeks. No procurement epic.

1

Week 0

One team, 10–100 people. Invited by email, and a named sponsor on your side and ours.

2

Weeks 1–8

People use it. We watch the held rate and completion, not the vanity numbers.

3

Weeks 9–12

Cohort report against baseline. Honest review — including whether it did nothing.

If it did not work, we would rather you knew at week twelve than bought a year. The annual term starts only if you choose to convert.

Give us one team and twelve weeks.

Two minutes of an employee's day. Thirty of yours to decide.

Next step

jessmove.com/industries

Bring your security lead. We will run the endpoints live while they watch.

Jess Move does not diagnose any condition and never contacts emergency services. In the UK, call 999 for an emergency and 111 for urgent health advice.
